Download Delphi Auto Diagnostic Software Torrent 1057 Responses: A: If you are looking for the general idea of the string, you can easily extract it using Regular Expressions, you can easily use Regex in.Net if you have installed it. I use this in C# with extracting strings (from byte[] bytearray) : Regex regex = new Regex(@".+?;"); Match match = regex.Match(bytearray); int bytes = match.Groups[0].Value.Length; string name = match.Groups[1].Value; To test it, use something like string bytearray = File.ReadAllText(@"C:\test.txt"); Regex regex = new Regex(@".+?;"); Match match = regex.Match(bytearray); int bytes = match.Groups[0].Value.Length; string name = match.Groups[1].Value; You can compare the two expressions, if you want to know how to get the Regex working in Delphi, I'd be happy to help. Edit - How do I get Delphi to work with Regex? First install Regex from the Global section. Next go the the project explorer on the Delphi side - open a new project, right click on the project (dart.dproj) then properties. Go to the project options, and there the first page is "Compile Options" where you will see "RegEx" (third tab). Give the registry value "Delphi Compiler - Regex Build" with the value 1. Now close the project. Now add uses RegularExpressions; to your code, and after that you can apply regex to strings with Regex regex = new Regex(@".+?;"); and string test = regex.Match(bytearray).Groups[1].Value; Cellular prion protein (PrPc) and Alzheimer disease pathogenesis. Prion diseases are fatal neurodegenerative disorders in humans and animals. The PrP protein (PrP) plays a crucial role in the pathogenesis of prion diseases. Recent genetic studies 570a42141b
