Nov 18, 2019 A: It should be easy to figure out what the code is doing, and if it's obfuscated. If it's in English then simply have a translation of the function and look at it. However, there are a few things that may make this a bit harder to debug. Use Process Explorer (free) or Process Monitor (free) to figure out what the code is doing when it is called. Keep track of the list of files that it generates. You'll want to open them and read them one by one. Watch the SQL statements that are generated. Depending on what web application the code was written for, they may be available. Using a browser, view the entire source code of the website that the code is trying to connect to. If they have only specific pages or URLs for which they are monitoring, you can narrow it down. If the code is obfuscated, then you are in for a world of pain. Q: How to rewind and make sure that dicts are aligned in a list after I used a list comprehension? I want to have a list with items that have two columns, organized as below: `{'x': 0, 'y': 0}, {'x': 1, 'y': 1}, {'x': 2, 'y': 2}` I know that the list comprehension should be rewritten to get the same output: `list_of_dicts = [{'x': 0, 'y': 0}, {'x': 1, 'y': 1}, {'x': 2, 'y': 2}]` And I do have a function that rewinds and returns dictionary of the same format and size as the previous list. `def rewind_list(): return [{'x': 0, 'y': 0}, {'x': 1, 'y': 1}, {'x': 2, 'y': 2}]` What I do is to then use the list comprehension to reset x and y from 0 to 1, then append the rewind function as follows: `list_of_dicts = [{'x': 0, 'y': 0}, {'x': 1, 'y': 1}, {'x': 2, 'y': 2}]` list_of_dicts 3ef4e8ef8d
