It was a rare sight for people in the Stamford area. For a whole day on Monday, except for a few early risers and a busload of visitors, Stamford's Greenbelt was completely empty, its vast and popular space near the highway overgrown with grass, weeds and wildflowers. The stretch of land in the city's center was closed to vehicular traffic to better buffer the swampy wetlands from heavy traffic. And so, for a day, the plant life that flourishes in the Greenbelt found themselves completely exposed to the elements and the public. A large section of the overgrown Greenbelt had been designated a temporary refuge for nature. The land had been cleared of vehicles, and dozens of us walked its length, taking pictures and admiring its wildlife, a lot of which - thanks to the Trump Administration's work to remove many environmental protections - was new to the area. It was a chance for residents to experience the greenery of the city from the natural side, which was something few residents get to do in Stamford. "This is not that far from where I live, so it is just nice to go here," said Amanda Malone, a Stamford resident. "I think this is a great way to get away from the highway and take in the nature around here." "This is probably my favorite section of the Greenbelt. The bugs are out, the deer are out, the butterflies are out, you can sit here and look at the birds and just smell the trees," said Shirley Culmsee, a Stamford resident. "It is relaxing and you can enjoy nature." "I am a birder. I see all kinds of different species here," said Dean Pratt, a birder. "This is a good place to get a feel for nature." Pratt said he was surprised at how quiet the Greenbelt was on Monday, and told NBC Connecticut that he had not seen so much wildlife since arriving to Stamford. He said he expected to see more bugs, but he was

Neoadjuvant chemotherapy with biweekly infusional oxaliplatin plus oral capecitabine for patients with locally advanced or metastatic gastric cancer: results of a phase II study. The combination of biweekly infusional oxaliplatin and oral capecitabine for the treatment of advanced gastric cancer has been shown to be active and well tolerated. We conducted a phase II study to determine the efficacy and toxicity of infusional oxaliplatin and oral capecitabine for the treatment of advanced gastric cancer and to determine the feasibility of administering this regimen on a biweekly basis. Patients with histologically or cytologically confirmed locally advanced or metastatic gastric or gastroesophageal junction adenocarcinoma were included. Patients received intravenous oxaliplatin on day 1 and oral capecitabine on days 1 to 14 of a biweekly cycle for a minimum of six cycles. Thirty-four patients were enrolled. The overall response rate was 37% (95% confidence interval, 20%-57%), and 25% of patients achieved a complete response. The median time to progression was 7.3 months (95% confidence interval, 5.8 to 9.0 months). The median overall survival was 15.2 months (95% confidence interval, 12.0 to 18.0 months), with a 1-year survival rate of 51%. Twenty-eight of 34 patients (82%) completed a minimum of six cycles. There were no treatment-related deaths. The most common grade 3/4 toxicities were neutropenia (42%) and thrombocytopenia (29%). Severe hand-foot syndrome occurred in 17% of patients. This phase II study shows that the combination of oxaliplatin and capecitabine has an acceptable safety profile and is active against advanced gastric cancer. Although the response rate was lower than that reported in the literature, the combination was well tolerated and feasible to administer on a biweekly basis.Q: What is the difference 2d92ce491b
