Was "La Niña" a hurricane, a cyclone, a severe tropical storm or just a name? A: The official NHC name for the one that occurred in October 2001 was "La Niña 01," which is also referred to as "El Niño". The name 'La Niña' is applied in the central and eastern Pacific to a statistical occurrence of the sea surface temperature anomaly (ESTCA) over the west Pacific and eastern Pacific. La Niña events tend to be relatively short-lived and do not result in a storm or hurricane. The name is a portmanteau of "La Nina" (the return of El Niño) and "Niña" (the Spanish word for "girl"), with a further correlation to the girl-named storms of the Atlantic. It is typically used for a weak La Niña event that lasts no more than about four months. The name is also used for long-duration weak La Niña events, which are typically named after the seasons in which they occur (i.e., "La Niña 2001" means the weak La Niña event of 2001). A: La Niña is a phenomenon that can lead to severe weather and tropical cyclones. This can be something that occurs in the Pacific, Atlantic, or even somewhere in between. The term is used to describe the ENSO phenomenon which occurs at the surface and at the ocean basins that surround the Earth.
