What's New in the UsbDesX?

UsbDesX is a handy and reliable application designed to copy data from your USB removable drives to the C drive of your computer. Usage is simple: after installation, run the application and press the 'Start' button. No other additional settings need to be made. The application supports drives of the USB 2.0 (and also 3.0) type, but in case of large amounts of data transfered, or if the drive is slow to read, UsbDesX can be set to run in low-priority mode, so as not to slow down the computer. UsbDesX, although very handy, also comes with some disadvantages: In the preferences, you can define how UsbDesX will behave when your USB device is disconnected and reconnected, e.g. when you unplug it from the computer and reconnect it. You can also choose whether you want UsbDesX to remain connected to the drive, or keep its driver running so it can reconnect automatically on the next connection to the USB drive. The application is not able to change its behavior when your USB device is locked (locked by a password, for example). You can also define if your USB device is presented to the computer as a removable drive (when the computer is connected to a USB port, and your computer has a configured USB-Storage) or as an external drive. If you choose to let the program keep its driver running, when you connect the USB drive to another computer, it will not automatically connect to your computer, but it will continue to work in your current computer. For this reason, it is strongly recommended that you set your USB drive to be an external drive.Q: How to loop through a specific number of elements in XML file and output to a csv file?
