

Adobe Photoshop CC 2015 Version 18 Free

* _Adobe Photoshop Elements:_ This little-known program is similar to Photoshop, and you can use it to create an unlimited number of raster files, but it offers far fewer editing options. It's most useful for beginners, as it is a fast, easy program that doesn't require many technical skills to use. However, it doesn't work with transparency like Photoshop does, so you need to be sure you're using it correctly before you make a major mistake. You may decide to use Photoshop Elements when you want to experiment with the program's basic features and consider doing a little basic retouching of images on a regular basis. * _Adobe Photoshop:_ Photoshop has much more power and features than Photoshop Elements, and for serious photo work, Photoshop is always the first choice. However, Photoshop doesn't work with transparency, which can be a detriment to a beginner who needs to add and manipulate images with transparency. * _Mac-based Photoshop:_ Although the computer OS you run Adobe Photoshop on is less important, Photoshop typically runs better on a Mac than on any other platform. If you're using a Mac and you plan to use Photoshop for serious work, you should probably use an Adobe Certified Creative Suite (ACS) program.

Q: numeric formatting, preserving leading zeros I need to add a field to a table, it has int2 and int4. One of them has been inserted with leading zeros, so it is 000060.0000110. When I insert it like this: INSERT INTO MyTable(Amount,Currency) VALUES ('000060','JPY') I want the data to be '060','JPY'. This is acceptable, and it handles properly if I add the data in with the leading zero. For example: INSERT INTO MyTable(Amount,Currency) VALUES ('0000060','JPY') but this makes things hard if I want to insert the data at the same time. For example, if I do this: INSERT INTO MyTable(Amount,Currency) VALUES ('0000060','JPY') Then I have to manually change the data back to zero. Is there any way to preserve the zero, and still treat it as an int2 or int4? I could truncate the data before insert, but it doesn't seem like a very elegant solution. A: Makes things hard to insert with 'leading zero' if I do this: INSERT INTO MyTable(Amount,Currency) VALUES ('0000060','JPY') What is not clear, you have a table of single values or a comma-separated list? INSERT INTO MyTable(Amount,Currency) VALUES (0, 'JPY'), ('0000060','JPY') Then you could add the field in SQL. You can also use TO_NUMBER in the INSERT INSERT INTO MyTable(Amount,Currency) VALUES (TO_NUMBER('0000060','00000'), 'JPY') or INSERT INTO MyTable(Amount,Currency) VALUES (TO_NUMBER(CAST('0000060' AS NUMBER(20)), '00000'), 'JPY') (I am not sure which to prefer as I haven't tested all of these.) TO_NUMBER is documented as: TO_NUMBER(expression, [precision]
