I am pleased to announce the release of hex2pdf, a standalone version of the hex2pdf.exe utility that we previously offered as a free download. As most of our fans of hex2pdf are surely aware, hex2pdf can convert files in Intel hex format to pdf and can thus be used to render the files in the PDF format that is commonly used to save e-books. Hex2pdf has always been a 100% freeware utility, available for windows, Mac and Linux systems. Now, this is no longer the case, as this version is a commercial product from us. Before proceeding further, I should stress that this version of hex2pdf is also a standalone program. It doesn't need any installation and it can be downloaded, unzipped and executed from any drive location without being tied to any windows application. It's also a direct link to the documentation that can be downloaded and printed using a PDF reader. Similarly to hex2pdf, hex2pdf 2.0 can transform Intel hex files into pdf format, but it provides a longer list of conversion options, including 8-bit binary and numerical formats. Conversion features As discussed previously, hex2pdf 2.0 permits you to: - convert intel hex files to pdf; - convert from Intel hex to 8-bit binary and numerical formats; - convert from 8-bit binary and numerical to Intel hex; - convert.hex files to pdf. Here's a brief list of some of its conversion features: - 2nd format: PDF - Destination format: pdf - Supported formats: PDF - Supported file types: intel hex, binary, numerical and CSV - Supports multiple files with a single command - Small in size - Fast conversion speed - Portable

Q: How do I change the colour/hue of a specific part of a vector layer's symbology? I'm using QGIS 3.4.6 and I have a vector layer of points with two attributes. For the first attribute, colour is fine. I need to change the colour of the second attribute however. I've looked up and down the menus but there's no apparent way to do this, and no answer to a related question I found. Any help would be greatly appreciated! A: From QGIS 2 to QGIS 3 the gdal plugin was removed and the properties of the symbology can now be modified through the layer properties. You can open them through the Layer properties dialogue (right click on layer -> properties) At the moment it's possible to modify the colours of the categorical legend only. But you could subclass this styles and add your 09e8f5149f

What's New in the Hex2file?

hex2file is a feather-light command-line utility that gives you the possibility to convert files with the Intel hex type to binary, text, 8-bit binary or CSV format. It features straightforward commands that don't necessarily require previous experience with console tools, making it accessible even for users who typically prefer the graphical interface over the Command Prompt environment. Doesn't need setup The whole program's wrapped in a single executable file that you can copy to a custom directory on the disk or move to a USB flash drive to effortlessly launch it on any machine. It doesn't need DLLs or other modules to work properly, add new entries to the system registry, or generate other files on the disk without letting you know about it. It's only necessary to delete this file to perform a complete uninstall. Seamlessly convert Intel hex files to other formats The usage is hex2file [format specifier].
