* *_Getting Started in Photoshop_*, by Chris Orwig and Kerrie McBride (O'Reilly), contains a very complete, lucid and thorough primer on the basics, with many useful illustrations. * * * # Photoshop is no Photoshop When the webmasters at *_dvk.org_* —the site for which Kurt Remy wrote the previous article in this series—started to sell corporate logos on their site, they decided that they wanted to standardize the look of their logo files. They installed a Photoshop plug-in that changed their file-format to the one that Photoshop uses. To set the plug-in aside, they uninstalled it from their Mac system. A few days later, Remy's boss in Washington DC called up and said that the site was generating complaints from people who had the logo that they bought on the site, and that they wanted to return their logo. Remy said that the logo wouldn't be available until the plug-in was installed again, and so his boss suggested that Remy leave the plug-in installed. After Remy's boss signed off, the art director at the site, Robert J. Hall, walked over to Remy and said, "Kurt, you're a genius. You've solved the problem." So Remy, whose argument was that a plug-in is a plug-in, backed down and explained that of course, since the plug-in would have to be installed to produce the file, it would be installed when the project is complete. And that would be whenever the client's logo was finished. (What happened to the 16th century religious-rights icon? TIFF images use the CMYK color scheme (the usual four process colors plus black) but are not compressed like the Graphics Interchange Format, so they require about five times the storage space when saving as files. BMPs use the CMYK color scheme and are compressed, so they take up less space. But they have other limitations. TIFFs can be transformed using simple image-editing tools, whereas B

John Rawls (1921-2002). This article discusses the life and thought of Professor John Rawls (1921-2002), one of the 20th century's leading political theorists, in the context of his professorial career. Rawls continued in the classic style of analytic philosophy. The views he took on political philosophy are known as "Theory A." He was a member of the Harvard faculty from 1946 until he died, and was appointed Distinguished Professor in 1986. His career and influence is shown by the many tributes he has received, in different disciplines, including the 2006 Nobel Prize in Economics. The opening section sets the context of his work. The next three sections outline the life and work of Rawls, in chronological order. Part II discusses the Theories of Justice (the basic ideas of the American tradition), which led Rawls to his Theory A. The final section of Part III discusses the Theory A itself, outlining both the main components and the unity in variety of Theory A. Enzymatic resolution of pyrazolidine-carboxylic acids. A microbial metabolic transformation of a racemic 1-aryl-1,3-dihydropyrazol-4-yl carboxylic acid was developed to yield a single enantiomer of the corresponding (R)-1-aryl-1,3-dihydro-1,5-pyrazolidine-4-carboxylic acid. This transformation involves the following three enzymatic reactions: ester hydrolysis of the carboxylate to produce the free acid, reduction of the acid, and aldol condensation of the resulting aldehyde to the (R)-1-aryl-1,3-dihydro-1,5-pyrazolidine-4-carboxylic acid. Image caption Some species of seaweed and jellyfish have also been affected Species of jellyfish and seaweed in the Mediterranean Sea have been affected by abnormally high levels of sulphur in the air. Some even show an increase in numbers since the winter. Scientists say the high levels of the gas in the air are probably a result of a large volcanic eruption in Indonesia. Seaweed and jellyfish caught off some Italian beaches have been found to have more sulphur than seawater in them. The abnormally high levels of the gas are something that has been known to occur in some cases in the Mediterranean Sea following volcanic eruptions. Image caption Only a few days of high levels of sulphur in the air - which are followed by a sharp fall - occurred last year However last year's unusually high levels of sulphur dioxide in the air was followed by just a few days of high sulphur levels, which were eventually followed by a sharp drop, something that has been lost over the past few days. A team of scientists from the Italian Institute for Environmental Protection and Research (ISPRA) and the Stazione Biologica Marittima di Sciacca have been studying the phenomenon. They say they are still not sure of the cause but that the levels of sulphur are usually in the region of 2 micrograms of sulphur per litre of seawater. What is very different this year is that levels of more than 16 micrograms have been registered off the coast of Sicily and the south of Italy - quite twice the levels to which most animals are accustomed. The scientists say they believe the abnormally high levels have been caused by a large eruption of sulphur-rich magma that occurred on Saturday, March 11, that is known to have led to the smoking mountain in the crater of Mount St. Elias in eastern Indonesia, the largest volcano in the country. "The temperatures caused by the eruption, the ash discharged and the very high sulphur dioxide levels remain, on the other hand, unchanged," said the team leader, Fabio Silvano. "That means the gas is very high in the atmosphere and it's diffusing in the sea, so that a concentration of sulphur in seawater has been created," said Mr Silvano. Micropayments have always seemed like an impossible idea. The smallest basic charge for sending a money transfer is £20
