The present invention relates to an electrolyte for an alkaline storage battery, and more particularly, to an alkaline storage battery such as a nickel-cadmium storage battery with an improved storage property. Heretofore, as an electrolyte for an alkaline storage battery such as a nickel-cadmium storage battery, an aqueous solution of an alkali metal hydroxide, e.g. sodium hydroxide or potassium hydroxide, has been generally used, and an aqueous solution of a bivalent or trivalent metal halide has been mixed with such alkali metal hydroxide. These metal hydroxide and metal halide solutions each have a high conductivity and are excellent with respect to storage property and safety. The electrode material for an alkaline storage battery such as a nickel-cadmium storage battery is usually made of nickel hydroxide. Therefore, the nickel hydroxide is always exposed to a cathode when the nickel hydroxide is oxidized. For example, it is proposed in Japanese Patent Laid-Open Publication No. 42369/1975 to use a metal halide selected from among a fluoride, a chloride, and a bromide of an alkali metal in a nickel-cadmium storage battery. Also, it is proposed in Japanese Patent Laid-Open Publication No. 41690/1979 to use a metal halide containing an alkali metal fluoride in combination with a metal oxide other than a halide in an alkaline storage battery. Furthermore, it is proposed to use an aqueous solution of alkali metal ions alone in combination with an anodic material in an alkaline storage battery in Japanese Patent Laid-Open Publications Nos. 252415/1988, 192254/1989, and 114298/1990. As mentioned above, the metal halide causes a decrease in conductivity in an 3e33713323
