Field The disclosure relates to a method, system, and article of manufacture for the autohealing of writeable cache. Description of the Related Art Storage controllers communicate with host systems by transmitting and receiving data over a network. In many storage systems, all or a portion of a system memory is implemented as a writeable cache. The writeable cache is a portion of a memory (e.g., main memory) that may be written to by a storage controller (a component in the storage system that manages access to the memory). Writeable caches are useful because they provide very

fast access to data, because they are typically physically close to the storage controllers (typically in the same central processing unit or chipset), and because they may be used to provide a secondary copy of data. It is also possible for the writeable cache to be a portion of a memory that may be written to by a storage controller. Writeable cache may be used to enhance storage controller performance by providing fast access to data. In some storage systems, a storage controller can automatically write data to a writeable cache that is accessed more frequently than the main memory. Reduction in the amount of H<sub>2</sub>O<sub>2</sub> entering the cell: a physiologic role for ATP-sensitive potassium channels. H<sub>2</sub>O<sub>2</sub> entering the cell at low pH is a major source of reactive oxygen species. The low pH/large H<sub>2</sub>O<sub>2</sub> environment promotes cellular functions leading to cell death, and therefore, ATP-sensitive potassium (KATP) channels provide a critical safeguard by blocking Ca(2+)-dependent or voltage-dependent release of cellular Ca<sup>2+</sup>. We previously showed that the KATP channel of vascular smooth muscle is directly activated by H<sub>2</sub>O<sub>2</sub>. The present study examined the mechanism by which H<sub>2</sub>O<sub>2</sub> activates the KATP channel and tested the hypothesis that the abundance of H<sub>2</sub>O<sub>2</sub> entering the cell contributes to its activation. In cell-free conditions, H<sub>2</sub>O<sub>2</sub> activated the KATP channel in a concentration-dependent manner. On exposure to low pH, the amplitude of KATP
