To draw an image inside a circle using the free selection tools, look for the command-K keystroke. You must select the desired section of the image and then set the drawing tool to fill the circle that you've selected. All that is needed to draw an image inside a circle are your basic selection tools and the command-K keystroke. Make your image conform to a specific design Using Photoshop's transformation tools, you can change the size, rotation, and skew of an image to fit a specific design. In this type of image-editing project, you have complete control over every element of the image. When you use a transformation tool, you may be able to run the program at a low performance level. If you need even greater control, you can make the image look different using the opacity of the layer masks. Notice that you can rotate and skew the image to make it appear to be any shape you want. You can transform the image into a wireframe to see exactly where the pixels will appear on the page when you print the image. Using the free selection tools, you can cut out the picture elements and then paste them into a new image where you want them to appear on the page. You can then paste the image into Photoshop and either duplicate the image to continue your work, or you can delete the file so it doesn't take up too much space on your hard drive. You can draw lines and boxes freehand, or use the Rectangular selection tool to create vector shapes. You can then add the drawing tools to a new layer, edit it, and then place the shape where you want on the page. You can even add a text layer to make text appear in the shape. You can also add special effects to photos such as vignettes, bokeh, blurs, and highlights. If you don't have the time to paint out the highlights, you can perform a selective image adjustment to make it appear that way. Manipulate layers When you use a painting or illustration program, you're working with layers of information. You can use the paint tools to manipulate the layers, and these tools often perform different functions than the tools available in Photoshop. Typically, layers don't physically exist in an image in the layers panel. Instead, the layers of an image are represented in a clever manner called a stacking order. So, if an object's drawing on a layer is visible or not, that object is visible in

What's New in the?

The present invention relates to a new and distinctive soybean variety, designated XB16F09 which has been the result of years of careful breeding and selection as part of a soybean breeding program. There are numerous steps in the development of any novel, desirable plant germplasm. Plant breeding begins with the analysis and definition of problems and weaknesses of the current germplasm, the establishment of program goals, and the definition of specific breeding objectives. The next step is selection of germplasm that possess the traits to meet the program goals. The goal is to combine in a single variety an improved combination of desirable traits from the parental germplasm. These important traits may include higher seed yield, resistance to diseases and insects, tolerance to drought and heat, and better agronomic qualities. These processes, which lead to the final step of marketing and distribution, can take from six to twelve years from the time the first cross is made. Therefore, development of new varieties is a time-consuming process that requires precise forward planning, efficient use of resources, and a minimum of changes in direction. Soybean (Glycine max), is an important and valuable field crop. Thus, a continuing goal of soybean breeders is to develop stable, high yielding soybean varieties that are agronomically sound. The reasons for this goal are to maximize the amount of grain produced on the land used and to supply food for both animals and humans. To accomplish this goal, the soybean breeder must select and develop soybean plants that have the traits that result in superior varieties. Pioneer soybean research staff create over 500,000 potential new varieties each year. Of those new varieties, less than 50 and more commonly less than 25 are actually selected for commercial use. The soybean is the world's leading source of vegetable oil and protein meal. The oil extracted from soybeans is used for cooking oil, margarine, and salad dressings. Soybean oil is composed of saturated, monounsaturated and polyunsaturated fatty acids. It has a typical composition of 11% palmitic, 4% stearic, 25% oleic, 50% linoleic and 9% linolenic fatty acid content ("Economic Implications of Modified Soybean Traits Summary Report", Iowa Soybean Promotion Board & American Soybean Association Special Report 92S, May 1990). Changes in fatty acid composition for improved oxidative stability and nutrition are also important traits. Industrial uses for processed
