Recent developments in digital photography and the World Wide Web have created an abundance of images and videos today that blur the line between professional and amateur photography. In the past, the only way to express a photographic talent was to use a professional-caliber medium such as film. Today, professionals and professionals-to-be can take full-length photographs with the use of a smartphone or DSLR, and the technology allows for editing and processing of these images. While it's evident that a professional setting usually produces a higher-quality image in terms of color reproduction, subjects, and sharpness, a general or amateur photographer may also be able to produce something that looks like a professional image. Photoshop makes it easy to correct mistakes made when taking photographs, whether by a professional or amateur. Once these errors are addressed, the photographer can send the photo to others for comment or critique or to be used as a tutorial for others. The fundamental building blocks of digital photography, raster images, typically come in a RGB (red, green and blue) color space. However, the process of editing an image typically involves the use of images in a CMYK (cyan, magenta, yellow and black) color space. Photoshop has recently added the ability to convert from RGB or CMYK to CMYK or RGB. Quality of digital photography has improved in the past decade and continues to improve. While the quality of DSLR and point-and-shoot cameras has increased, the quality of images shot by smartphones is also improving. As time goes by, the quality of phone pictures will likely continue to improve. Although the basic mechanics of taking a picture with a smartphone are the same as those of a camera, it is important to note that not all smartphones are created equal and there are some misconceptions about smartphones and photographs. Smartphones are not the same as film. Smartphones take still pictures, can be used for both still and video photography, provide good quality color, can be connected to computers and external storage devices, and can even upload the picture directly to a Web site. Most smartphones have small cameras and can take sharp photos that require little post-processing. While the quality of the photos varies with camera phone models, they're usually sharp and crisp. If you want to get the best quality images from your smartphone, connect it to a computer or storage device and upload the image to a social media or blog Web site. A picture taken with a smartphone can be improved easily with Photoshop

Many events are inaccessible to blind and visually impaired persons. This can make it difficult to fully participate in sports and activities, or to follow due dates of processes or projects with regard to deadlines or due dates. One of the most common tools used in the art to aid visually impaired persons with location of an object is a tactile map of the object. There are various forms of tactile maps in the art. Often, tactile maps are used to show an object's physical location, and the tactile map's use of brightly colored markers is intended to allow visually impaired persons to follow the markers as they move around the object to find it. Conventional tactile maps, however, do not provide any guidance or information on how to proceed if an object is not found. Moreover, the markers cannot detect a large number of objects, such as in a sports stadium or a school field. Thus, a heretofore-unaddressed need exists in the industry to address the aforementioned deficiencies and inadequacies.
