Have at least a basic knowledge of using a computer. The basics don't require a degree, but you do need to understand the various functions of a computer, including the keyboard, mouse, and monitor. Have an interest in learning about using a computer to create images (photographic or otherwise). Be able to read and understand the directions on the manual that accompanies Photoshop. Have access to a second computer, a printer, and a scanner. This is to enable you to help with the testing of your edited images. You will need an Internet connection to access the Internet, email, and the Google sites. Photoshop doesn't provide an easy means of outputting images; it's very basic in terms of multiple color space capabilities and exporting options. Organizing Photos For those who have taken their camera-and-trip-adventure to the next level, organizing images is essential. The only way to have a successful trip is to take lots of pictures of all the wonderful sights you see. However, the vast majority of your images are going to be boring photos of mundane subjects. However, you don't want to be so organized that you forget to have fun. That would be a pity. Learn to take advantage of your camera's modes and settings for some creative effects, such as taking panoramic images, taking multiple shots of the same subject using burst mode, and capturing fast moving subjects. Chapter 13 gives more details about these modes and settings. You need to make some basic decisions, such as determining how you want to organize and store your images. Your choice should be based on how you plan to use your images. This section shows how to organize images on a computer. You can also organize images online, using photo-hosting services, but then you don't get the advantages of a central database and you have to deal with the limitations of their software and web browsers. This section examines several free and Web-based options for organizing and storing your digital images. Most are free and some, such as Flickr, allow you to upload your images to a public database. I cover storing your images online in Chapter 6. Downloading images to the computer You must download images from your camera to the computer. This is the most important step in working with your images. You can usually download to a separate folder on your hard drive, and save the file to your computer by using the Save function. You can

This application relates generally to the production of titanium-containing compositions and the like, and more particularly to the production of amorphous solid solutions of titanium in aluminum, aluminum alloys, and other beryllium-containing metals. The invention is particularly concerned with the production of amorphous titanium containing solid solutions in aluminum and aluminum alloys, for use as substrates in the electroplating of coatings which provide corrosion protection against sea water, and at the same time improve the adhesion of the coating to the substrate. Various titanium containing compositions are useful as substrates for various coatings. In particular, titanium containing substrates are suitable for use in the electroplating of such coatings as chromium for corrosion protection and anticorrosion adhesion. While it is known that titanium in aluminum and titanium alloys, e.g., Ti-6Al, may be electroplated to form adherent and corrosion protective coatings, the plated product is generally brittle and exhibits poor adhesion. Typically, such platings exhibit poor mechanical properties, especially in high stress areas. In certain instances, however, it is desirable to electroplate a second coating which will improve the adhesion of the electroplated layer. Such a coating is described in U.S. Pat. No. 4,519,802 to Cagle and U.S. Pat. No. 4,578,157 to Cagle et al, which disclose coating titanium with a cobalt-chromium-molybdenum alloy to provide the desired properties. The '802 and '157 patents, in addition, describe a process for producing titanium alloys by first impregnating various metals into molten titanium, and then consolidating the impregnated molten titanium in a vacuum or inert gas atmosphere at a pressure of about 10<sup>sup</sup>-6 to 10<sup>sup</sup>-8 Torr or less. Inert gases such as argon are particularly useful because the pressures used in the process leave pores in the Ti-containing articles, and because these pores effectively fill with other metals while the other metals are solidified. An advantage of the '802 and '157 processes is that a relatively high purity titanium starting material may be used, and the starting material is not charged with excess aluminum or other metal which would complicate the removal of the aluminum or other metal from the final product. Unfortunately, prior art processes for the production of titanium-containing products are relatively expensive, complex, and time-consuming. A need exists, therefore,
