The aim of this study was to determine the relationship between work-related stress and depression, measured as common workplace variables (depressive symptoms and cynicism) and organizational variables (job insecurity, conflict with other workers and organizational commitment). The sample was taken from middle managers working in public hospitals and health centres, with a sample size of 253 individuals in three health centres and five public hospitals. The results showed a strong significant relationship between the variables measured: work-related stress and depressive symptoms, and between the work-related stress variables, depressive symptoms and cynicism. The variables "organizational commitment" and "depressive symptoms" were found to be significant predictors of "work-related stress". On the other hand, "job insecurity" and "organizational commitment" were found to be significant predictors of "depressive symptoms". Overall, the health centres had more "depressive symptoms" and fewer "organizational commitment" and "job insecurity" than the hospitals. The study reveals that work-related stress and cynicism are potentially important factors in the development of depression among middle managers in Brazilian health care organizations.Leonard Chalmers Leonard Chalmers, b. The game seems to lack the code to work with the latest iOS (it runs fine on 5.1.1). I strongly advise you to stay away from this and any other game from "Big Fish Games" since they have a habit of releasing buggy iOS versions. READ THE WARNINGS before you get in trouble.
