Here is a quick (but not very reliable) comparison between Photoshop CS6 and Photoshop Elements 12. Adobe Photoshop and Adobe Photoshop Elements Why would someone want to use Photoshop Elements? Using Elements is a great alternative to using the more expensive Photoshop. One drawback is that, like most online apps, it's not available on all platforms. But if you don't have the budget for Photoshop, Elements is a great choice to get started. It offers a lot of features that keep photographers, graphic designers, web designers and many others who use images happy. In this guide, we will show you everything you need to know about working with photos in Photoshop Elements. What can I do with Photoshop Elements? Like Photoshop, Photoshop Elements can edit, organize, filter, retouch, and create images. It also comes with other basic tools, including a ruler, three rulers, and a full-screen view mode. The interface is designed to be as simple as possible. Adobe's marketing tactics have made us believe that elements 'is' Photoshop. Is it really? There is no doubt that Photoshop CS6 is not Photoshop, so why Photoshop Elements 12 has to be Photoshop? Probably it is because of an event that happened in 2010. Adobe Photoshop got tired of a blue version of the square template in Photoshop Elements. So Adobe decided to change the template. This was apparently Photoshop's first step to making Photoshop elements look like Photoshop. The development of Elements is constantly updating the way that Elements looks in comparison to Photoshop. But Elements now has elements for Photoshop and Photoshop for elements. If you want to learn the basics of Photoshop Elements you can start here. In this guide, you can learn how to create a basic PSD file in Photoshop Elements. What's new in Photoshop Elements 12? There are a lot of changes and a big update this year. Officials have arrested two people in connection with a deadly highway hit-and-run accident in which a 13-year-old girl was killed and her two cousins were injured early Monday morning, according to Kentucky State Police. Shortly before 5 a.m., Christopher Kennedy, 22, was driving on northbound U.S. 25E near South Second Street in South Laurel when he lost control of his vehicle and struck the side of a 2000 Ford pick-up truck, which had stopped in the northbound lanes to avoid a traffic hazard, according to State Police. Kennedy immediately fled the scene and was last seen heading north on Hopewell Road. A 13-year-old girl and two boys, one 12 and another 14, were inside the truck when Kennedy hit them. The 13-year-old girl, who is the daughter of the children's mother, was pronounced dead at the scene. The other two boys were taken to the hospital with non-life-threatening injuries. "As of right now we do not know what, if any, drugs, alcohol, or speed was a factor in this crash," Sgt. Stephen Howe said on the scene. Howe said the girls' mother had been in the backseat of the Ford truck with her daughters. "She [the mother] was still not in any condition to be interviewed," he said. Kennedy was taken into custody Thursday morning after he was found hiding in a shed at a home on West Clyde Road near South Laurel. He is charged with aggravated vehicular homicide, fleeing and attempting to elude, driving under the influence and no proof of insurance, according to state police. Harcourt County Commonwealth's Attorney Kevin Pope told WSAZ the driver's license and vehicle registration were found in the car. Lee County Sheriff's Office deputies said the children all lived in the same home. Howe said they have been working with the girls' mother to get them transferred to a family member. Kennedy is being held at the Harcourt County Detention Center on a \$50,000 bond. The crash remains under investigation.

Q: Would it be possible to use an annotation processing tool to find all occurrences of a stream in a .java or .csv file? Lets say I wanted to write a utility method that would do the following: In the class Main.java there is some method called Main.someMethod(InputStream in, OutputStream out). The InputStream is defined in someInputStream.java. The OutputStream is defined in someOutputStream.java. In this case, my utility method should return a list of every method which is called by Main.someMethod. My issue is that there are many ways to read and write to streams. A parser/generator can't tell which class is using which stream. I was thinking that the simplest way would be to have an annotation processing tool process the existing Main.java class, and for each occurrence of InputStream, OutputStream, Scanner, or Reader it would get the corresponding .java files, and generate all the source for each call to Main.someMethod. For example, for a simple call like this: `InputStream in = getClass().getResourceAsStream("/input/testFile.csv");` `OutputStream out = getClass().getResourceAsStream("/output/testOutput.csv");` Generate: `public static void main(String[] args) throws IOException { java.io.InputStream in = getClass().getResourceAsStream("/input/testFile.csv"); java.io.OutputStream out = getClass().getResourceAsStream("/output/testOutput.csv"); Main.someMethod(in, out); }` So you would be able to see which class is using which stream by looking at which class contains which method. Is it possible to use an annotation processing tool to do this? A: You can use the javaCompiler API for this. All you need to do is use `@ProcessElement` and the `ClassVisitor` to create a representation of the entire program (including imports). Then you can use the `ClassReader.readClassFile()` method to get to the line you're interested in, and then the `Class.getMethod()` method to get information about the method. The annotation is located in `org.jetbrains.annotations` which you can add to your compiler arguments with the `-Xshare`:
