If you installed Windows 10 without using a USB flash drive, it could be the problem. You need to run it again and try to delete the file. If that doesn't work, look for anything like Win10.cmd or Win10.bat in your settings file. Once you delete it, it will go away. This software works as advertised. It is easy to set up, access to the fly tag seems to be very easy. There are two areas where this software is really lacking: 1. The added mobile capability is a weak point in the program. It's really poor. It will not link to my Outlook or other email, it won't maintain a log of my tagged species, it won't sync with Google, or any of the other things that are being done in all the other apps. It also doesn't seem to be able to add records automatically when imaged. Finally, it won't add records for groups of tags. I had to go and manually input all the groups on my tags into the application to get it to work. This makes the program pretty useless at this point. 2. The poor lister is a real barrier to use.
